

In the Claims

The status of claims in the case is as follows:

1. [Currently amended] A computer implemented method for detecting denial of service attacks, comprising the steps of:

issuing a bit encoded login challenge in response to a login request to said computer from a requester of services; and

responsive to an incorrect response to said challenge, said computer placing said requester in a state of limited service.

2. [Currently amended] The computer implemented method of claim 1, further comprising the steps of:

filtering out to said state of limited service iterative connection requests from a network address of a hacker device.

3. [Currently amended] The computer implemented method of claim 1, further comprising the step of:

responsive to speed, latency and average queuing network delay of connection requests, detecting and placing in a state of limited service repetitive login requests from a hacker device.

4. [Currently amended] The computer implemented method of claim 3, further comprising the steps of:

determining from said speed, latency and average queuing network delay a time-out value; and

detecting as a request from a hacker device a request that does not complete within said time-out value.

5. [Currently amended] The computer implemented method of claim 1, further comprising the steps of:

issuing further challenges to subsequent requests for service from said requester and selectively responding to successful responses by continuing service at the same or improved level and to unsuccessful responses by

further reduction or complete denial of service.

6. [Currently amended] The computer implemented method of claim 1, further comprising the steps of:

periodically issuing said challenges throughout connection to a requester successfully responding.

7. [Currently amended] The computer implemented method of claim 1, comprising the step of issuing said bit-mapped challenge as logon image from which a user must select or enter a response.

8. [Currently amended] The computer implemented method of claim 7, further comprising the step of occasionally shifting the input area for a valid response to said challenge.

9. [Currently amended] The computer implemented method of claim 1, further comprising the step of slowing acceptance from and response to systems in a degraded service category.

10. [Currently amended] The computer implemented method of claim 1, further comprising the step of counterattacking by

executing a denial of service response to attacking systems.

11. [Currently amended] A computer implemented method for detecting denial of service attacks, comprising the steps of:

executing a bit-encoded challenge-response login procedure and a network probing test frame transmission and analysis procedure to detect a hacker denial of service attack;

said network probing test frame transmission and analysis procedure including defining a signature of discrete speed, streaming speed, and latency of the connecting device failing said bit-encoded challenge-response login procedure, and adding said signature to a router based filter for filtering out login requests from said hacker responsive to said signature; and

responsive to detecting said denial of service attack, placing said hacker in a lower level of service state.

15. [Currently amended] A computer implemented method for detecting denial of service attacks, comprising the steps of:

selecting sending and receiving probative test packets through a network;

responsive to said packets, determining network evaluation parameters for said network;

responsive to said network evaluation parameters, determining presence of network denial of service attacks, said network evaluation parameters including response time and throughput characteristics of said network, said throughput characteristics including capacity, utilization, and performance; and

executing a challenge-response procedure to discourage and repel said attacks.

16. [Currently amended] The computer implemented method of claim 15, further comprising the steps of:

END920000185US1

6 of 20

S/N 09/945,172

determining a latency and speed fingerprint of an offending device;

responsive to said fingerprint, operating a router filtering system to reject packets from said offending device.

17. [Currently amended] The computer implemented method of claim 16, said fingerprint comprising a rhythm of transmissions of discrete, burst, and stream packets.

18. [Currently amended] A computer system for detecting and responding to denial of service attacks, comprising:

a test station for identifying a zombie source of said denial of service attack;

a low quality server for serving said zombie source;
and

a high quality server for serving legitimate sources of request for services.

19. [Currently amended] The computer system of claim 18,

END920000185US1

S/N 09/945,172

further comprising:

a load balance server for directing said zombie source to said low quality server.

20. [Currently amended] The computer system of claim 19, said zombie source being [[an]] a server addressable on an Internet containing trojan-horse code.

21. [Currently amended] The computer system of claim 18, said test station performing testing by use of ICMP pings to identify said zombie source.

22. [Currently amended] The computer system of claim 21, said test station further for determining patterns of traffic generated by well-known attack scripts for subsequent use in identifying said zombie source.

23. [Currently amended] The computer system of claim 21, said test station further for determining a timeout value for completion of a login request for freeing control blocks responsive to a login request which does not complete within said timeout value.

S/N 09/945,172

24. [Currently amended] A computer implemented probative test and analysis method for detecting and responding to denial of service attacks on a network resource, comprising the steps of:

creating a template of attack patterns;

determining historical, current, and predicted states of said network for each of a plurality of types of network traffic;

responsive to said attack patterns, determining if a spike in network traffic is a distributed denial of service attack and, if so, determining its source; and

denying full service to sources associated with said service attack.

25. [Currently amended] The computer implemented method of claim 24, further comprising the steps of:

determining unique speed and latency network attachment characteristics of devices attempting to connect to said network resource; and

END920000185US1

S/N 09/945,172

responsive to detection of an abusive behavior from a said device, responding to subsequent requests for service from said device by denying said full service to said device.

26. [Currently amended] A computer program product storage device readable by a machine, tangibly embodying a program of instructions executable by a machine to perform method steps for detecting denial of service attacks, said method steps comprising:

a computer readable medium;

first program instructions to issuing issue a bit encoded login challenge in response to a login request from a requester of services; [[and]]

second program instructions, responsive to an incorrect response to said challenge, placing to place said requester in a state of limited service; and wherein

said first and second program instructions are recorded on said computer readable medium.

30. [Currently amended] A computer program product storage device readable by a machine, tangibly embodying a program of instructions executable by a machine to perform method steps for detecting denial of service attacks, said method steps comprising:

a computer readable medium:

first program instructions for executing a network probing test frame transmission and analysis procedure to detect a hacker denial of service attack; [[and]]

second program instructions, responsive to detecting a denial of service attack, for placing said hacker in a state of lower level of service; and wherein

said first and second program instructions are recorded on said computer readable medium.

31. [Newly added] A computer program product for detecting

denial of service attacks, comprising:

a computer readable medium

first program instructions to selectively send and receive probative test packets through a network;

second program instructions, responsive to said packets, to determine network evaluation parameters for said network;

third program instructions, responsive to said network evaluation parameters, to determine presence of network denial of service attacks, said network evaluation parameters including response time and throughput characteristics of said network, said throughput characteristics including capacity, utilization, and performance;

fourth program instructions to execute a challenge-response procedure to discourage and repel said attacks; and wherein

said first, second, third, and fourth program

instructions are recorded on said computer readable medium.

32. [Newly added] The computer program product of claim 26, further comprising:

third program instructions for filtering out to said state of limited service iterative connection requests from a network address of a hacker device; and wherein

said third program instructions are recorded on said computer readable medium.

33. [Newly added] The computer program product of claim 26, further comprising:

third program instructions, responsive to speed, latency and average queuing network delay of connection requests, for detecting and placing in a state of limited service repetitive login requests from a hacker device; and wherein

said third program instructions are recorded on said computer readable medium.

37, further comprising

fourth program instructions for occasionally shifting the input area for a valid response to said challenge; and wherein

said fourth program instructions are recorded on said computer readable medium.

39. [Newly added] The computer program product of claim 26, further comprising

third program instructions for slowing acceptance from and response to systems in a degraded service category; and wherein

said third program instructions are recorded on said computer readable medium.

40. [Newly added] The computer program product of claim 26, further comprising

third program instructions for counterattacking by executing a denial of service response to attacking
